IDENTIFIERS	*Pennsylvania

ABSTRACT

Data on professional nurses in Pennsylvania for the period 1958-1968 is brought together, correlated and presented in table form. Enrollment in associate and baccalaureate programs increased while diploma programs changed little. The age level of professional nurses is rising in Pennsylvania and the U.S. as a whole. Between 1949 and 1966 the number of employed hospital and office nurses increased, but private duty and public health nursing declined. About 70 0/0 of Pennsylvania nurses are married. Distribution of nurses by age, educational level, marital status, employment status, and type of position is compared for Pennsylvania's six Human Service Regions, twelve Standard Metropolitan Statistical Areas, and 67 counties in table form. PREFACE

This report, a joint publication of the Pennsylvania Nurses Association (PNA) and the Hospital Educational and Research Foundation of Pennsylvania (HERF) affiliated with the Hospital Association of Pennsylvania, is primarily statistical in nature. It deliberately does not attempt to make judgments or reach conclusions regarding the recruitment, education and utilization of professional registered nurses, but rather attempts to provide a better and, in some cases, unique development of new statistical data. Therefore, this compilation of statistical material is oriented primarily to those charged with planning for the better utilization of health care facilities and their most important resource, trained health manpower.

This report, moreover, is an example of voluntary cooperation between PNA and HERF. Both organizations contributed their resources in terms of financial participation in the compilation of the data and the publication of this report, as well as in the necessary staff work needed to organize the resulting data. The Hospital Educational and Research Foundation made its contribution through the Health Manpower Intelligence Facility which is funded by the Bureau of Health Professions and Manpower Training (USPHS Contract #PH 108-67-200).

Much of the data contained in this report is from secondary sources, that is, other published data; however, this has been compiled in such a manner that for the first time there is an adequate statistical description of professional nurses, their education, and utilization in Pennsylvania. Much of the additional data has resulted from the Nurse Licensure Applications regarding the characteristics, education, and employment status of nurses throughout the Commonwealth who are licensed by the Nurse Licensing Board. This information is unique and is for the first time published in this format.

Our appreciation must go to Lucie S. Young, R.N., Ph.D., President, and Anne O. Winkler, R.N., Ed.D., of the Pennsylvania Nurses Association, and Dr. Ray Stine, James Spallone and Linda Cohen of the Foundation. Special thanks must go to Miss Mary Bell and James Spallone, who were directly responsible for this publication and were involved with it from the very beginning.

Anyone desiring additional information regarding this report or additional copies of it may contact:

Section I

PROFESSIONAL NURSE EDUCATION

NURSING EDUCATION

The changes taking place in nursing education are shown in the shift in numbers of programs offered to persons wishing to enter nursing. The number of diploma programs offered by hospitals is declining; programs in junior or community colleges which offer an associate degree and senior college programs offering a baccalaureate degree are on the increase.

Total programs offered in the United States in 1958 numbered 1,136, of which 926 were diploma programs, 38 associate and 172 baccalaureate programs. By 1968 the number of programs had increased to 1,278, of which 721 were diploma, 324 associate and 233 baccalaureate programs. (See Table 1 and Chart 1)

As the number of programs increased, admissions moved upward also. In 1957-58 there were 43,937 admissions to initial professional programs. Of these, 36,118 were admissions to diploma programs, 953 to associate degree, and 6,866 to baccalaureate degree programs. Ten years later the number of admissions had increased over 1958 admissions to 60,673. (See Table 2)

The numbers and percentages (see Chart 2) of students entering associate and baccalaureate degree programs increased substantially during the 1958-1968 period, while admissions to diploma programs leveled off. Admissions to baccalaureate programs increased by 7,947 during the period. The increase in admissions was even greater in the associate degree category, with 13,624 more admissions in 1968 than in 1958. Admissions to diploma programs declined, however, by 4,835 during the period.

Total enrollments in initial programs moved steadily upward from 112,825 in 1958 to 144,024 in 1968. Associate degree enrollments increased in this period by 25,105 and baccalaureate degree enrollments increased by 20,962. However, enrollments in diploma programs declined by 14,868. (Table 3)

Graduations from nursing schools increased from 30,239 in 1957-58 to 41,245 in 1967-68. Most of the growth was attributable to the marked increase in graduations from associate degree and baccalaureate schools. Graduations from diploma schools remained relatively constant at about 26,000 annually, but there was a steady decline throughout the period in the proportion of graduations from diploma programs. (Table 4 and Chart 3)

There has been little overall change in numbers of programs within Pennsylvania in the ten year period from 1958 to 1968. There were 110 programs in 1958 and 114 in 1968. Diploma programs decreased from 103 to 95 in this period, associate programs increased from 1 to 7 and baccalaureate programs from 6 to 12. (Table 1 and Chart 4)

The 4,484 admissions in 1967-68 to Pennsylvania diploma schools constituted 87.5 percent of total admissions that year. Ten years earlier diploma schools had 4,331 admissions, or 96.8% of the total. The 209 admissions to associate degree schools in 1967-68 were 4.1% of all admissions. In 1957-58 only 7 admissions or two-tenths of one percent of the total were to associate degree schools. There were 429 admissions to baccalaureate schools in 1967-68, compared to about one-third that number, or 138, ten years previously. Thus baccalaureate schools increased their share of admissions from 3.0% in 1957-58 to 8.4% in 1967-68. (Table 2 and Chart 2)

In 1968, 11,437 nursing students were enrolled in diploma programs in Pennsylvania, compared to 11,701 in 1958. Enrollments in associate degree schools in 1968 were 414, compared to only 12 in 1958. In 1968, 1,411 students were enrolled in baccalaureate schools. The figure ten years earlier had been 509. (Table 3)

In 1968, 86.2% of all Pennsylvania enrollments were in diploma schools. Ten years earlier this figure had been 95.7%. Associate degree enrollments in 1968 made up 3.1% of all admissions for the year, but only one tenth of one percent in 1958. The respective percentage shares for baccalaureate enrollments were 10.7% and 4.2%.

Graduations from initial nursing programs in Pennsylvania reflect similar shifts in proportionate shares among the three types of schools. The 4,272 graduations from diploma schools in 1967-68 represented 92.7% of all graduations in that year. A decade earlier the 3,462 diploma school graduations in 1957-58 had made up 97.1% of total graduations for that year. By contrast, asso-

ciate degree and baccalaureate schools in 1967-68 increased both their shares and numbers of graduates over 1957-58. (Table 4 and Chart 3)

In addition to the initial baccalaureate programs, there are programs which admit graduates from diploma or associate degree programs to matriculate for a baccalaureate degree. Graduations from such programs for the United States were little changed in the ten year period with 2,067 in 1958 and 2,142 in 1968.

In 1968, Pennsylvania schools granted 15.3% of baccalaureate degrees given to graduate nurses in the United States. Pennsylvania's share of these post-RN baccalaureate degrees, for selected years is as follows: (Table A)

Pennsylvania's share of the number of nurses in the United States who earned masters degrees in these same years is as shown below: (Table B)

Pennsylvania in 1968 had two programs for masters degrees in nursing and one doctoral program in nursing. There were 66 such master's programs and 6 such doctoral programs in the United States in 1968.

Characteristics of Professional Nurses

According to the ANA national inventories made in 1949, 1951, 1956-58 (1957 used in this report for this inventory), 1962 and 1966 age distribution statistics have shown a rising age level for professional nurses. In 1949, 22.5% of active[1] registered professional nurses were 45

[1] Active nurses are those professionally employed as nurses; inactive nurses are those not so employed.

TABLE A

Year	Number of Graduates[1] Pennsylvania	United States	Pennsylvania's Share of United States Total
1958	217	2,067	10.5%
1960	241	2,513	9.6
1962	236	2,345	10.1
1964	198	2,413	8.2
1966	237	2,363	10.0
1968	327[2]	2,142[2]	15.3

[1] American Nurses Association. *Facts About Nursing*, 1968 edition. New York: The Association (1968). 247 pp. See also earlier annual editions.
[2] Personal communication, National League for Nursing.

Programs leading to masters and doctoral degrees in nursing have in the last few years enrolled increasing numbers of students. In 1958, 997 masters degrees in nursing were granted; in contrast 1,615 were granted in 1968. Twenty three doctoral degrees were granted in 1968.

TABLE B

Year	Number of Graduates[1] Pennsylvania	United States	Pennsylvania's Share of United States Total
1958	50	997	5.0%
1960	31	1,197	2.6
1962	47	1,098	4.3
1964	57	1,282	4.4
1966	83	1,279	6.5
1968	69[2]	1,615[2]	4.3

[1] American Nurses Association. *Facts About Nursing*, 1968 edition. New York: The Association (1968). 247 pp. See also earlier annual editions.
[2] Personal communication, National League for Nursing.

years of age or over; this percentage increased to 36.7% in 1966 (Table 5). The inactive nurses followed the same pattern but in each inventory the percentage of active nurses who were 45 or over was higher than the proportion of inactive nurses in this age group. (Table 6)

In Pennsylvania age trends followed those for the United States with 21.5% of active registered professional nurses 45 years of age or over in 1949 and 30.0% in 1966 (Table 5). In line with national trends the percentage of active nurses 45 or over has been higher than that for inactive nurses in each of the inventory years. (Tables 5 and 6)

Median ages as computed from grouped inventory age data increased 7 years from 1949 to 1966 for the active nurses in the United States and 6 years for the inactive. In Pennsylvania during this period the increase in median age for the active nurses was 5 years and for the inactive, 3 years. The changes in median ages are indicated in the following table: (Table C)

The increase in the proportion of married nurses in Pennsylvania and the United States during successive inventory years is shown in Table D below. In each inventory year the proportion of married nurses among working nurses in Pennsylvania has been about the same as that for the United States while the proportion of inactive Pennsylvania nurses who are married has been slightly higher than the proportion for the United States.

Fields of Employment—United States

From 1949 to 1966 the number of employed nurses has grown from 299,067 to 593,694. During this period, hospitals and other institutional employers have employed the greatest number of nurses and have steadily increased their proportionate share of those who are employed. In 1949, the first inventory year, hospitals employed 47% of working nurses; by 1966 the latest inventory

TABLE C

Inventory Year	Median Age			
	Active Registered Nurses[1]		Inactive Registered Nurses[1]	
	Pennsylvania	U.S.	Pennsylvania	U.S.

year, this figure had increased to 65%. (Table 7)

The next largest field of nursing is private duty nursing. In 1949, about 22% of employed nurses were in private duty. The percentage of nurses working in this field has steadily decreased from 22% of all actively employed nurses in 1949 to 15% in 1957 and to 10% in 1966.

The third largest field of nursing is that of office nursing, with 47,628 nurses in this field in 1966. The number of office nurses has increased steadily in each inventory since 1949, but the field's proportionate share of the total nurse supply has remained at a relatively stable 8% or 9%.

A total of 46,349 nurses said they were employed as public health or school nurses in 1966. A reported 7.8% of employed nurses were working in this field in 1966—a slight increase over the 7.6% in 1962, but under the proportion of 1949, when this field embraced 10% of the employed nurses.

Nursing education took fifth place in numbers of nurses in 1966, with 20,818 nurses indicating they were employed in this field. Proportionately this field of nursing lagged from 1949 to 1957, when its share of all employed nurses dropped from 4.0% to 2.9%. Since 1957 nursing education as a field of employment has moved slowly up to nearly regain the relative position it held in 1949.

A total of 18,155 nurses, or 3.1% of employed nurses, were working as occupational health nurses in 1966. This field of nursing has not held its proportionate share of working nurses but rather has fallen steadily from 4.4% in 1949 to 3.1% in 1966.

A small proportion of the employed nurses were working in central administrative agencies or other type agencies, or in nursing organizations. All these nurses were included in the "other" category.

Fields of Employment—Pennsylvania

The number of Pennsylvania nurses who are employed has grown in each inventory period, increasing from 23,252 in 1949 to 39,645 in 1957 and 40,497 in 1962 and to 42,430 in 1966. (Table 7)

Over the years hospitals and other institutions have continued to be, by increasing margins, the largest employers of nurses in Pennsylvania. In 1949, 9,440 or 41% of nurses were hospital or institutionally employed. The number had more than doubled by 1957 and increased again by about a fourth from 1957 to 1966. The proportionate share was 53% in 1957, 59% in 1962, and 62% in 1966.

Private duty, ranking next in numbers with 6,329 nurses at work in this field, comprised in 1966 about 15% of employed nurses. This number is only slightly under the 6,627 at work in 1949, but the field has been declining steadily as a proportion of the working nurse population since 1949 when the share was 29% of the nurses at work.

Public health nursing (including school nurses) was the third largest field in 1966, with a reported 3,313 nurses, or 7.8% of the employed nurses supply. These nurses have become more numerous since 1949, but the share of all employed nurses they represent has declined from 10.9% in 1949 to 7.8% in 1966.

About 7% or 2,746 of the nurses said they worked in physicians' or dentists' offices in 1966. The number of office nurses has steadily increased since 1949, but their share of the employed nurse supply has remained at about 6%.

Nursing education in 1966 was the fifth largest employment field for nurses. A total of 1,773 or 4.2% of all working nurses were employed in schools of nursing in 1966. In numbers employed this field had grown steadily since 1949, but its proportionate employment share fell steadily until 1957, when the trend was reversed, and by 1966 the field again employed 4.2% of working nurses.

Occupational health nurses increased their numbers from 1949 to 1957, but since the latter year, the number of nurses so employed has declined. Proportionately there has been a steady drop from 1949 when the field had a little more than 5% of working nurses. By 1966 only 1,415 nurses, or 3.3% of the working population, were employed in occupational health.

There is a small group less than 1% in each inventory, which is classed as "other." These are nurses who are employed, as mentioned earlier, in such places as nursing organizations and government agencies.

In 1966 in the United States 54% of the employed nurses were in general duty or staff level positions; 15% were head nurses and 13% administrators or supervisors. The staff level positions included nurses who worked alone, such as those employed in occupational health, in physicians' or dentists' offices, and in some public health settings. (Table 8)

In Pennsylvania in 1966, the proportions were 52% in general duty or staff level positions, 12% head nurses and 12% administrators or supervisors. (Table 8)

Section II

CHARACTERISTICS OF PENNSYLVANIA LICENSED PROFESSIONAL NURSES 1966

CHARACTERISTICS OF PENNSYLVANIA NURSES 1966

In 1966, a total of 99,421 nurses held licenses to practice in the Commonwealth of Pennsylvania (Table E). Of this total 42,430 stated on the renewal application they were employed (active) as nurses in the state, while another 26,818 indicated they were not professionally employed anywhere (inactive), but resided in the state. An additional 4,573 nurses said they lived in Pennsylvania, but did not indicate whether or not they were employed in nursing, either in Pennsylvania or elsewhere.[1] (Table E)

Of these 99,421 nurses, then, 73,821 could be categorized as Pennsylvania nurses either by the fact of employment or residence there, or both. It is with this broadly defined group of nurses that the statistical analysis which follows will be concerned.

TABLE E

Category	NUMBERS				PERCENTAGES			
	All Nurses	Active Nurses	Inactive Nurses	Unknown Status	All Nurses	Active Nurses	Inactive Nurses	Unknown Status
All License renewals	99,421	56,577	37,276	5,568	100.0%	56.9%	37.5%	5.6%
Nurses employed in Pennsylvania, or those inactive residing in Pennsylvania	73,821	42,430	26,818	4,573	100.0	57.5	36.3	6.2
Other Nurses licensed in Pennsylvania	25,600	14,147	10,458	995	100.0	55.3	40.8	3.9

1/ 25,600 other nurses held Pennsylvania licenses in 1966 of whom 14,147 were employed in other states, and 10,458 were inactive and residing in other states. The remaining 995 nurses resided outside the Commonwealth, but did not indicate whether or not they were working.

Age Characteristics of Pennsylvania Nurses

As Tables 9 and 9a show, almost half or 47.4% of the professional nurses in Pennsylvania in 1966 were under 40 years of age. Their median age was 37.7[2]. A similar proportion, 48.7%, of employed nurses was also under 40, with a median age of 38.1. Inactive nurses were slightly younger on the whole than active nurses. About 53% of inactive nurses were less than 40 years of age and their median age was 36.8.

Marital Status of Pennsylvania Nurses

Approximately 70% of Pennsylvania nurses in 1966 were married. Among those active in nursing, 64.9% were married, and among those who said they were not employed as nurses, 89.2% were married.

Age and Marital Status Related to Activity

Additional insight into the employment patterns of Pennsylvania nurses can be gained by relating both age and marital status to activity. Over half of the inactive nurses, for example, were both married and under 40 years of age. The median age of married inactive nurses was 35.8 years.

About 68% of the married nurses under the age of 25 were active in nursing (Chart 5). The proportions who were active then decreased to 49% of married nurses between the ages of 25 and 29 and to 44% of those between 30 and 34. Beginning with the 35-39 age group the percentage of employed married nurses began to increase until by ages 45 through 49, 61% were employed. For each 5 year interval from the age of 50 onward the percentage began to decrease again.

Single, widowed, divorced, or separated nurses were overwhelmingly active in their profession. Almost 97% of single nurses under the age of 25 were working. The employed percentages in this group tended to decrease slightly in the older age categories, but even between the ages of 60

[1] 25,600 other nurses held Pennsylvania licenses in 1966 of whom 14,147 were employed in other states and 10,458 were inactive and residing in other states. The remaining 995 nurses resided outside the Commonwealth, but did not indicate whether or not they were working.

[2] All median ages were calculated from grouped age data.

and 64, over three-fourths of the single nurses were working.

A similar pattern of high employment was evident for divorced, widowed, or separated nurses. About nine-tenths of these nurses at all age levels under 60, and about four-fifths of those between 60 and 64, were working.

Single inactive nurses had a median age of 53.2 years. One-third of them were at least 60 years old. Inactive nurses who were divorced, widowed, or separated had a median age of 46.6 years and almost two-fifths were 50 or older.

Married inactive nurses on the other hand were concentrated in the younger age groups. Their median age was 35.8 and almost 60% were under 40 years of age.

Educational Preparation of Pennsylvania Nurses

Almost 54,000 or over 70% of Pennsylvania nurses indicated on their renewal applications they held less than an undergraduate degree (Table 10). Sixty-four percent of the nurses at this educational level reported they were working. (Table 10a)

Nurses holding baccalaureate degrees comprised only about 7% or slightly less than 5,500 of Pennsylvania nurses (Table 10b). Almost two-thirds of these nurses were working.

Only about 1,200 or less than 2% of the nurses held advanced degrees (masters or beyond). However, three-fourths of these were actively employed as nurses.

Age and Education Related to Activity

Table 11 shows by age and level of education the employment status of Pennsylvania's 73,821 nurses in 1966 while Chart 6 depicts by level of education the percentage of nurses in 1966 who were active at each age interval. Substantially the same percentages of nurses with baccalaureate degrees and nurses without degrees were active at all ages, except between the years 50 and 59 when baccalaureates were somewhat more active. At most age levels nurses holding advanced degrees were more active than nurses with a baccalaureate degree or less.

Field of Employment of Pennsylvania Nurses

By far the largest number, 26,291, or 62.0% of Pennsylvania's 42,430 active nurses were employed in hospitals or other institutions in 1966 (Tables 12 and 12a). The second largest field of employment was private duty nursing which accounted for 6,329 or 14.9% of employed nurses. Other fields of employment, with the percentages of nurses they contained, were as follows: Office Nurse, 6.5%; School Nurse, 4.7%; Nursing Education, 4.2%; Occupational Health, 3.3%; Public Health Nurse, 3.1%; other fields, 0.2%; and unknown field, 1.1%.

Educational Preparation and Field of Employment of Pennsylvania Nurses

Tables 12 and 12a also show the educational level distribution by field of employment for Pennsylvania nurses in 1966. Almost 70% of employed nurses with less than a baccalaureate education were employed at that time in hospitals or other institutions, while another 22% were working as private duty or office nurses.

Almost 40% of nurses holding baccalaureate degrees were also employed by hospitals or other institutions. About one-fifth were working as school nurses, and another 22% were employed in nursing education.

The largest single field of employment for nurses with advanced degrees (masters and beyond) was in nursing education. Over 40% of nurses at this educational level were so employed. An additional third of these nurses were employed in hospitals or other institutions.

The majority of positions in most fields were held by nurses without degrees. (Table 12b) The exception was nursing education, where two-thirds of the nurses held baccalaureate or advanced degrees. A sizable minority, 44.7%, of school nurses also were trained at the baccalaureate level or beyond.

Age and Field of Employment of Pennsylvania Nurses

Nurses employed in hospitals or other institutions had the lowest median age, 34.7, of all employed Pennsylvania nurses in 1966 (Table 13). Close to 60% of these institutionally employed nurses as Table 13a shows were less than 40 years of age. Only about 15% were 50 years of age or older. Half of all nurses employed in nursing education or as office nurses were also under 40 years of age. Their median ages were 38.1 and 38.0, respectively.

Fields in which older nurses predominated in 1966 were public health, private duty, occupational health, and school nursing. The proportions of nurses 40 years of age or older in these employment categories ranged from 51% to 66%. Median ages of nurses in these fields were all over 40 years.

Type of Position Held by Pennsylvania Nurses

Table 14 relates the positions held by Pennsylvania nurses to their fields of employment. This relationship is approximately as expected, i.e., the majority of administrators, or their assistants, supervisors, head nurses and general duty nurses were employed in hospitals or other institutions and nearly all of the nurses in the "other" category were employed as private duty nurses. About 70% of all the nurses in the general duty classification worked in hospitals or other institutions.

Because of their numerical preponderance in Pennsylvania, nurses trained at less than the baccalaureate level held a majority of types of positions in 1966 (Table 15). The major exception was the position of instructor; nearly 70% of nurses working as instructors held baccalaureate or advanced degrees. A slight majority of administrators, assistant administrators, and consultants also were holders of baccalaureate or higher degrees.

Geographic Distribution of Pennsylvania Nurses

Another characteristic which can be considered in an analysis of professional nurses in Pennsylvania is their geographic distribution throughout the State. However, it should be pointed out that county of employment was not requested on the license renewal application. For this reason, the nurses' mailing addresses were coded and this information was added to the original punch cards before data processing began. Consequently, any county or other regional tabulations of the 42,430 actively employed nurses will reflect the geographic areas in which they either resided or maintained mailing addresses, and not necessarily the geographic areas in which they were employed. This limitation in the data should be kept in mind throughout the analysis which follows.

Human Service Regions

Outlined on Figure 1 are the six Human Service Regions (HSR) into which Pennsylvania has been divided. These Regions were created by order of the Governor so that the various State agencies would have common jurisdictional lines and could more effectively coordinate their services. Tables 16 and 18 show, on a percentage basis only, Human Service Regions tabulations of some of the characteristics of the Pennsylvania nurse population for which State totals were given earlier.

Nurses' Activity Status in Human Service Regions

Shown in Table 16 are percentages of nurses in each Human Service Region who were employed in 1966. Very little variation is revealed by this Table in the proportions of nurses who were active. The lowest ranking Region, Region V, had 56.8% of its nurses employed, while the highest figure 59.6%, for Region VI was only slightly larger.

Nurses' Age Distributions in Human Service Regions

Table 16 displays, for Pennsylvania nurses in total, and Table 18, by employment status, median ages and percentages of nurses under 25 or at least 45 years of age. No marked differences are evident throughout the Regions in age patterns, although in most Regions inactive nurses had a slightly lower median age than did active ones.

Marital Status of Nurses in Human Service Regions

About 70% of the nurses in each Region reported they were married (Table 16). Slightly more than half the married nurses, and about 85% of the single, divorced, widowed or separated nurses in each Region reported they were working.

Educational Preparation of Nurses in Human Service Regions

Region I, with 10.4%, ranked first in the proportion of nurses with baccalaureate or advanced degrees (Table 16). Region IV with 6.7% was last. The percentage of nurses holding less than a baccalaureate degree ranged from 71.7% in Region I to 75.3% in Region VI.

In four of the six Regions, advanced degree holders were more likely to be working than were either baccalaureate or less than baccalaureate trained nurses. The exceptions were Regions III and IV, where greater proportions of both baccalaureate and less than baccalaureate educated nurses were employed. (Chart 7 and Table 18)

Field of Employment of Nurses in Human Service Regions

As would be expected, the greatest number of active nurses in each Human Service Region, in 1966 were employed in hospitals or other institutions (Table 18). These institutionally-employed nurses, together with private duty and office nurses accounted for at least four-fifths of the working nurses in each of the Regions.

Nurses in Human Service Regions per 100,000 population

The lowest ratio of all nurses to 100,000 population was 511 in Region I, the highest was 749 in Region II (Table 17). The number of active nurses per 100,000 population ranged from 300 in Region I to 433 in Region II (Table 17). Only two Regions, I and III, were below the State figure of 366 active nurses per 100,000 population. Hospital nurses had their smallest concentration for 100,000 population, 179, in Region I and the largest, 265, in Region IV.

Standard Metropolitan Statistical Areas

Figure 2 is an outline map of Pennsylvania which identifies the State's 12 Standard Metropolitan Statistical Areas (SMSA). A Standard Metropolitan Statistical Area is defined as a county or a group of contiguous counties containing at least one city of 50,000 population or more, or "twin cities" with a combined population of at least 50,000. Contiguous counties are included in an SMSA if they are essentially metropolitan in character and are socially and economically integrated with the central city. Percentage tabulations by SMSA of certain characteristics of nurses (age, marital status, etc.) are presented in Table 19. The following is a summarization of the data contained in this table:

Employment Status—The lowest percentage of employed nurses, 55.4% was in the Allentown and Harrisburg Standard Metropolitan Statistical Areas; the highest percentage, 61.3%, was in the Scranton SMSA.

Age Distribution—Nurses in the Johnstown and Pittsburgh Standard Metropolitan Statistical Areas had the lowest median age, 36.7, while those in the Harrisburg and Altoona Standard Metropolitan Statistical Areas had the highest. The Harrisburg SMSA had the smallest percentage of nurses under 25, 6.9%, while the Pittsburgh SMSA had the largest, 9.7%.

Marital Status—The highest proportion of married nurses, 78.7% was reported in the York SMSA, the lowest proportion, 63.4%, in the Wilkes-Barre SMSA.

Educational Level—The Erie SMSA with 11.3% ranked highest in the percentage of nurses holding baccalaureate degrees or higher degrees. Scranton, with 6.8%, ranked lowest.

Field of Employment—Hospitals and other institutions were the largest employers of nurses in each of the SMSA's. The proportions of nurses who were institutionally employed ranged from 54.5% in the Scranton SMSA to 68.8% in the Johnstown SMSA.

Pennsylvania Counties

Appended to this report is a group of tables which provide for each of Pennsylvania's 67 counties the following statistical information:

1. Age and marital status for both active and inactive nurses.
2. Age and educational level for inactive and active nurses.
3. Age and field of employment for active nurses.
4. Educational level and field of employment for active nurses.
5. Educational level and type of position for active nurses.

Tabulations are on a numerical basis only; percents have been omitted.

TECHNICAL NOTES

TECHNICAL NOTES

BACKGROUND

Five inventories of registered nurses have been conducted by the American Nurses Association. The inventories of 1962 and 1966 were done under contract with the Public Health Service. All studies utilized a standard set of questions prepared by the American Nurses Association. The questions are, in most instances, part of the application form, which is distributed through state licensing agencies and completed by the individual nurse for her license.

The nurses are counted in the state in which they are employed or in the state where they reside if not employed in nursing.

Many nurses maintain licenses in more than one state. Nurses, although registered in at least one state, may not be registered in the state where they are located. The elimination of duplicate licenses prior to 1966 depended on comparison of the name and address of the nurse. Duplicates might not be found under this system if the information on all forms was not identical or if a nurse married and a license in one state was issued under her maiden name and from another state under her married name. With the sort by the Social Security number, it is felt that this difficulty was lessened in the 1966 study.

The first two inventories, 1949 and 1951, were based on information secured from special questionnaire surveys and the final data were adjusted for non response so that all nurses were classified as active or inactive. For detailed information on the methodologies used, see *The Nation's Nurses* and *R.N.'s 1966*.

ANA INVENTORY

The ANA inventory figures for Pennsylvania as published in *1968 Facts About Nursing* were arrived at after completion of the inter-state sorting process. The ANA count of registered nurses shows a total of 75,353 composed of 43,382 employed in nursing, 27,978 not employed in nursing and 3,993 whose employment status is not reported.

PNA-HERF INVENTORY

The license records used for this study of Pennsylvania were the total licenses counted before the inter-state sort. The total count was 73,821, with 42,430 employed in nursing, 26,818 not employed in nursing and 4,573 of unknown employment status.

The larger counts in the ANA inventory in number of active nurses can be attributed to the inclusion of nurses employed by the federal government who are not required to have a Pennsylvania license and other nurses who may be working in Pennsylvania in the permissive one year period.

The difference in inactive nurses indicates the inclusion of those nurses who carry a license from another state and reside in Pennsylvania but have no Pennsylvania license.

NURSING EDUCATION

The figures on nursing education cover a 10-year span, 1958-1968, which incorporates the latest available data. These figures carry data about education 2 years beyond the licensure data of 1966, the latest year for which licensure information is available.
